

PRESS RELEASE

REGINA'S MAINTENANCE-FREE CHAIN NOW AVAILABLE ALSO FOR MEDIUM DISPLACEMENT MOTORCYCLES

The historic company from Cernusco Lombardone, expands the revolutionary HPE range adding a 520 application, product completely made in Italy, available from November 2022

Innovative, revolutionary and 100% made in Italy. Regina announces the arrival of the 520 application in its Z-Ring High Performance Endurance (HPE) range, the world's first maintenance-free chain. Two years after the launch of the 525 application for motorcycles with large cubic capacity engines, the historic company from Cernusco Lombardone (LC) now arrives on the market with a product dedicated to medium displacement two-wheelers.

Available as early as this November, the new 520 Regina HPE chain contains all the unique and successful features of its bigger sister. Among the most important is the Tetrahedral Amorphous Carbon (ta-C) coating developed by Regina technicians and applied to the surfaces of the chain bushes and rollers, which guarantees resistance, smoothness and, above all, allows to eliminate the periodic re-lubrication carried out by the rider every 500 km. An exclusive feature that, in addition to increasing its efficiency and duration, minimizes the environmental impact produced by splashes of lubricant while riding.

Finally, thanks to the important production volumes achieved in recent years with the HPE 525 chain, Regina has managed to develop economies of scale that have allowed the Italian company to reduce the production costs of these chains. "A competitive advantage that - underlined Paolo Garbagnati, CEO of Regina - we wanted to share with the market, making the entire HPE range much more accessible to all users and enthusiasts through sales price reduction, despite the difficult period, characterized by the continuous growth of energy and raw material costs".
